

Unit 1: The Human Body

The human body is an amazing machine. It has many parts that all work together to keep us alive and healthy.

The skeleton is the frame of our body. It is made of bones. We have two hundred and six bones. Bones hold our body up, protect our organs, and allow us to move.

Muscles are attached to our bones. When we move, our muscles pull on our bones. Muscles make us strong. Exercise makes muscles bigger and stronger.

The heart is a muscle too. It is found in the chest. The heart pumps blood around the body. Blood carries oxygen and food to every part of the body. The heart beats about seventy times every minute without stopping.

The lungs are in the chest on either side of the heart. We breathe in air through our nose and mouth. The air travels down to the lungs. The lungs take oxygen from the air and pass it into the blood. We breathe out carbon dioxide.

The brain is inside the skull. It controls everything we do. Thinking, remembering, feeling, and moving are all controlled by the brain. The brain sends messages along nerves to every part of the body.

The stomach and intestines digest food. When we eat, food is broken down into small parts that the body can use for energy and growth.

The skin covers and protects everything inside. It keeps out germs and helps us feel temperature.

Looking after your body means eating healthy food, drinking water, getting enough sleep, and exercising regularly.
